代码生成工具v1.1开发

联系QQ: 2816010068, 加入会员群

目录

- V1.0版本存在的问题
- Go template实战
- V1.1版本架构优化

• 代码写死,不好维护

```
fmt.Fprintf(file, "var server = &controller.Server{}\n")
   fmt.Fprint(file, "\n\n")
   fmt.Fprintf(file, "var port= \":12345\"\n")
   fmt.Fprint(file, "\n\n")
   fmt.Fprintf(file,
func main() {
   lis, err := net.Listen("tcp", port)
   if err != nil {
       log.Fatal("failed to listen: %v", err)
   s := grpc.NewServer()
   hello.RegisterHelloServiceServer(s, server)
   s.Serve(lis)
```

```
fmt.Fprintf(file, "package main\n")
fmt.Fprintf(file, "import(\n")
fmt.Fprintf(file, `"net"`)
fmt.Fprintln(file)
fmt.Fprintf(file, `"log"`)
fmt.Fprintln(file)
fmt.Fprintf(file, `"google.golang.org/grpc"`)
fmt.Fprintln(file)
fmt.Fprintf(file, `"github.com/ibinarytree/koala/tools/koala/output/controller"`)
fmt.Fprintln(file)
fmt.Fprintf(file, `hello "github.com/ibinarytree/koala/tools/koala/output/generate"`)
fmt.Fprintln(file)
```

```
defer file.Close()
fmt.Fprintf(file, "package controller\n")
fmt.Fprintf(file, "import(\n")
fmt.Fprintf(file, `"context"`)
fmt.Fprintln(file)
fmt.Fprintf(file, `hello "github.com/ibinarytree/koala/tools/koala/output/generate"`)
fmt.Fprintln(file)
fmt.Fprintln(file, ")\n")
fmt.Fprintf(file, "type Server struct{}\n")
fmt.Fprint(file, "\n\n")
for _, rpc := range d.rpc {
    fmt.Fprintf(file,
        "func (s *Server) %s(ctx context.Context, r*hello.%s)(resp*hello.%s, err error){\nreturn\n
        rpc.Name, rpc.RequestType, rpc.ReturnsType)
```

• Generator 之间有依赖关系,执行的时候可能会出错

• Golang中的map是无序的,每次遍历都不一样

```
func (g *GeneratorMgr) Run(opt *Option) (err error) {

   for _, gen := range g.genMap {
      err = gen.Run(opt)
      if err != nil {
         return
      }
   }
   return
}
```

- 模板替换
 - {{}}来包含需要在渲染时被替换的字段, {{.}}表示当前的对象
 - 通过{{.FieldName}}访问对象的属性

• 模板替换

```
package main
import (
              "fmt"
              "os"
              "text/template"
type Person struct {
             Name string
              age string
func main() {
             t, err := template.ParseFiles("./index.html")
             if err != nil {
                           fmt.Println("parse file err:", err)
                           return
             p := Person{Name: "Mary", age: "31"}
             if err := t.Execute(os.Stdout, p); err != nil {
                           fmt.Println("There was an error:", err.Error())
```

• If 判断

条件

```
not 非
{{if not .condition}}
{{end}}
                          and 与
{{if and .condition1 .condition2}}
{{end}}
                           or 或
{{if or .condition1 .condition2}}
{{end}}
                           eq 等于
{{if eq .var1 .var2}}
{{end}}
                           ne 不等于
{{if ne .var1 .var2}}
{{end}}
                          It 小于 (less than)
{{if lt .var1 .var2}}
{{end}}
                          le 小于等于
{{if le .var1 .var2}}
{{end}}
                           gt 大于
{{if gt .var1 .var2}}
{{end}}
                           ge 大于等于
{{if ge .var1 .var2}}
{{end}}
```

• With 语法

```
<html>
   <head>
   </head>
   <body>
       {{with .Name}}
       hello, old man, {{.}}
       {{end}}}
   </body>
</html>
```

模板 • 循环

```
<html>
   <head>
   </head>
   <body>
       {{range .}}
          {{if gt .Age 18}}
          hello, old man, {{.Name}}
          {{else}}
          hello,young man, {{.Name}}
          {{end}}
       {{end}}
   </body>
</html>
```

- 模板化
 - 把原来在分散在代码中的模板代码,抽象到模板文件中

```
fmt.Fprintf(file, "package main\n")
fmt.Fprintf(file, "import(\n")
fmt.Fprintf(file, `"net"`)
fmt.Fprintln(file)
fmt.Fprintf(file, `"log"`)
fmt.Fprintln(file)
fmt.Fprintf(file, `"google.golang.org/grpc"`)
fmt.Fprintln(file)
fmt.Fprintf(file, `"github.com/ibinarytree/koala/tools/koala/output/controller"`)
fmt.Fprintln(file)
fmt.Fprintf(file, `hello "github.com/ibinarytree/koala/tools/koala/output/generate"`)
fmt.Fprintln(file)
```

• 接口重新定义

```
import (
    "github.com/emicklei/proto"
)

type Generator interface {
    Run(opt *Option, meta *ServiceMetaData) error
}

type ServiceMetaData struct {
    service *proto.Service
    messages []*proto.Message
    rpc []*proto.RPC
}
```

• DirGenerator去掉,在GeneratorMgr中进行预先创建好

- 增加router模块
 - GRPC====» Router===» Controller
 - Router可以注入一些,打点统计,以及中间件

- Controller改造
 - Controller每个方法,单独抽象一个类进行处理
